Graph Breakdown and Calculations

Control Limits: The range of expected variation based on historical data, calculated as three standard deviations above and below the mean. Approximately 99.7% of the data points fall within the limits, assuming a normal distribution. Points that exceed the range indicate the process might be out of control and require further investigation.

Upper Control Limit: The highest value expected from the process under normal variation.

Lower Control Limit: The lowest value expected from the process under normal variation.
